On June 12, 1959, the Public Health Service issued PHS Publication No. 663, 'National Water Quality Network Annual Compilation of Data, October 1, 1957-September 30, 1958', a compilation of water quality data representing the information collected during the first year of operation of the National Water Quality Network. This Supplement to the original document is a summary of certain segments of the raw data which appear to need immediate consideration because of their urgency or newness -- such as the more recent measures of water quality - radioactivity, organic chemicals and plankton in surface waters. It is not intended to be an exhaustive analysis of the data or an interpretation of what the data may mean. Computations were made and tabulations were prepared for printing on electronic data processing equipment, thus making easily available many comparisons of monthly and annual parameters. Organic chemicals and plankton are summarized on a 20-river basis, by name of river.

This is the second annual compilation of data from the National Water Quality Network of the Public Health Service. This year the Network has added Strontium-90 and heavy metals analyses to the examinations made during the first year. The following examinations are considered to be of greatest value in meeting the objectives of the program: Radioactivity, Plankton populations, Coliform organisms, Organic chemicals, Biochemical, chemical, and physical measurements, and Trace elements.

Descriptors: (*Reservoirs, *Water quality), (*Water pollution, Reservoirs), Reviews, Dissolved gases, Oxygen, Aeration.
Identifiers: *Destratification.

The volume contains all the technical papers prepared from data collected for the project Influence of Impoundments and Controlled Releases on Water Quality, from September 1962 through December 1966. Research on this project was divided into two broad categories: (1) investigative research, designed to better understand reservoir water quality behavior; and (2) engineering research, designed to develop engineering methods for the control of reservoir water quality. Papers included in this Compilation cover a review of the literature and a statement of research needs; research on the dissolved oxygen budget in reservoirs, on the behavior of the nitrogen cycle in reservoirs, on the behavior of synthetic organics in stratified reservoirs, and on the use of artificial destratification as an engineering technique for managing and maintaining good quality water in reservoirs. AIR POLLUTION - A NATIONAL PROBLEM.

1962, 56p PHS-Pub-975

Descriptors: (*Air pollution, *United States).

Air pollution has been defined as the presence in the outdoor atmosphere of substances in concentrations sufficient to interfere directly or indirectly with man's comfort, safety, or health, or the full use and enjoyment of his property. The booklet presents information about some of the many factors which influence the nature and extent of the nation's air pollution problems. Included are maps which show graphically major potential sources of air pollutants in the 50 States. Also shown are the activities of governmental agencies toward the goal of attaining more effective control of air pollution.

Identifiers: *Clear cutting.

A number of studies were undertaken related to effects of clearcut logging on water quality and the process affected in small streams. Water temperature studied before and after logging was increased significantly where stream cover was removed. Energy balances of small streams were measured and predictive models were developed. Road building significantly increased sediment yield in clearcut and patch cut watersheds. Logging itself was not an important sediment contributor. Methods for sampling bed load and suspended sediment were developed. Bed load constituted 70 percent of suspended load during peak discharges. (Author)

Descriptors: (*Food sanitation, *Manuals), Regulations, Standards.

During the past 15 years, advances in the field of food technology, together with a distinct change in the social pattern of living in this country, have perceptibly altered the eating habits of the American people and the types of food-service operations being employed in public food-service establishments. In recognition of these changes, a new food service sanitation manual has been developed as a guide for both public health agencies and the food-service industry. It sets forth the need, purpose, and scope of a food-protection program, and suggests ways and means whereby effective programs may be implemented.

Contract DI-14-12-814

Descriptors: (*Algicides, *Bioassay), Pesticides, Toxicology.

The objective of this project was to discover a compound which would effectively and economically control the growth of nuisance species of bluegreen algae and would also exert a minimum impact on the more desirable aquatic life. A computer search was made of some 80,000 compounds and thirty-three were selected for testing. Those compounds which gave at least 80% control at 2.0 ppm against both Microcystis aeruginosa and Anabaena flos-aquae, the specified target species of blue-green algae, were selected for secondary screening tests at 1.0,0.5 and 0.1 ppm. Of the thirty-three compounds tested, four were selected for further research in the long-range algaecidal development program. In addition, an organism, Ochromonas ovalis, was discovered whose phagocytic action against Microcystis sp. was enhanced by compounds having algaecidal properties. (Author Modified Abstract)

Descriptors: (*Water supply, *Reviews), (*Water treatment, *Reviews).

The manual is to serve as a guide to Public Health Service engineers in evaluating the sanitary features of water supplies with which they are concerned. The text is divided into four sections. Part I gives those features of water-supply systems

which are of sufficient importance to be included in a sanitary survey, and lists major sanitary defects and health hazards, which, if present, would be detrimental to the safety of the water supply. Parts II and III deal, respectively, with recommended sanitary requirements for water treatment and for water-distribution systems. Part IV has been added as an explanatory discussion of the bacteriological and chemical requirements for potable drinking water as set forth by the 1946 Public Health Service Drinking Water Standards.

1965, 36p PHS-Pub-1306
An addendum, Evaluation Check List for Wisconsin Mastitis Test, is inserted.

Descriptors: (*Milk, Tests), (*Food sanitation, Milk).

The milk regulations in most progressive areas require that milk shall be from one or more healthy cows; that it shall be practically free of colostrum; and that milk otherwise abnormal should not be offered for sale. The screening tests described in this booklet are all based on the number of leucocytes in the milk. They are four which are currently in common use, as well as a recent modification of the CMT test. The Milk Quality Test (MQT)has not been included in this publication because of the scarcity of well-documented, scientific reports concerning the significance of positive results in terms of leucocyte counts.

Descriptors: (*School buildings, *Environments), Architecture, Design criteria, Environmental engineering.

Between the ages of five and sixteen, the average child spends many of his waking hours within the school environment. That this environment should be both as suitable and as healthful as possible has been an accepted premise for many years. Yet a long-standing need has existed for a comprehensive, over-all statement of basic environmental criteria for schools, by which either existing or planned facilities could be evaluated. The publication endeavore to meet that need. The basic recommendations and the standards that it contains are the result of three years of thorough and careful study, in cooperation with school officials, sanitary engineers, sanitarians, and expert consultants across the Nation.

Descriptors: (*Poisons, *Handbooks), (*Pesticides, *Toxicology), Toxic diseases, Phosphorus organic compounds, Carbamates, Chlorine organic compounds, Rodenticides, Pyrethrum, Fungicides, Herbicides, Organic solvents, Insecticides.

The Handbook replaces the 'Clinical Memoranda on Economic Poisons,' which were first issued in March 1950 as separate releases on several new insecticides. Attention has been given to those materials that are manufactured in large amounts, that are known to have caused posioning relatively frequently, or that are of special interest for some other reason. Sections have been devoted to arsenic, thallium, phosphorus, and kerosene because they are leading causes of deaths associated with pesticides. The Handbook was prepared primarily for the guidance of physicians in the diagnosis and treatment of persons who may have had extensive or intensive exposure to economic poisons; however, it contains general information that may be of interest to others also.

Descriptors: (*San Gabriel River, *Reservoirs), (*Texas, *Water resources), (*Brazos River Basin, *Reservoirs).

The purpose of this supplement is to update and revise certain information presented in the original report. These corrective measures became necessary when: The non-federal interest rate used for discounting and determining annual costs was changed from 3 to 4 per cent; A structure at the Laneport site was added to the plan which had originally called for just two reservoirs on the San Gabriel River; A revised estimate was made of the amount of ground water that municipal and industrial interests might totally develop in the area by the year 2010; The size and cost of the proposed Somerville project on Yegua Creek were changed. The information provided is intended to revise only those sections or topics of the original report which are related to the four items mentioned above.

The report presents the results of an investigation to determine water requirements to the years 2020 and 2070 for municipal, industrial, and water quality control purposes in the Walnut River basin and how these needs may be met. An estimate of the average annual benefits which could be ascribed to storage allocated to these purposes is evolved from projected economic developments and anticipated needs for water supply and stream quality preservation.

Descriptors: (*Walla Walla River Basin, *Reservoirs), (*Washington (State), *Water resources), (*Oregon, *Water resources), Forecasting.

The investigation was undertaken by the Public Health Service, Division of Water Supply and Pollution Control, to determine the potential needs for and value of storage for municipal, industrial, and quality control purposes. Water requirements were examined for areas within Walla Walla and Columbia Counties, in Washington, and Wallowa and Umatilla Counties, in Oregon. Future needs were projected to the year 2010, with an interim point at 1985. An economic base study and forecast of future population and industrial growth was prepared for this purpose and is summarized in this report.

Descriptors: (*Skunk River Basin, *Reservoirs), (*Iowa, *Water resources), Forecasting.

The purpose of the study was to determine the present and future needs and value of municipal and industrial water supply and storage for water quality control on the Skunk River in the reaches affected by the proposed reservoirs. This includes parts of the following Iowa counties: Hamilton, Boone, Marshall, Polk, Jasper, Powshiek, Marion, Mahaska, Keokuk, Washington, Wapello, Jefferson, Henry, Lee and Des Moines. The water requirements and the means and benefits (both tangible and intangible) of meeting those requirements have been investigated. The scope of the study covers water storage needs during a one-hundred year study period, 1960 to 2060.

STORAGE FOR MUNICIPAL AND INDUSTRIAL WATER SUPPLY COPAN, SAND AVANT, AND SKIATOOK RESERVOIRS AND STREAM QUALITY CONSIDERATIONS LOWER VERDIGRIS RIVER BASIN OKLAHOMA.
Jun 61, 43p
Prepared in cooperation with Army Engineer District, Tulsa, Oklahoma.

Descriptors: (*Verdigris River Basin, *Reservoirs), (*Oklahoma, *Water resources), Forecasting.

The purpose of the investigation was to determine the present and anticipated future needs for storage in the four reservoirs to meet projected municipal and industrial water demands; to examine the waste disposal and stream quality problems incident to such water use; and to estimate the monetary values of storage for water supply and for stream quality maintenance. A special feature of the study is the consideration of the effect of canalization of the lower Verdigris River on the stream's capacity to assimilate municipal and industrial wastes.

The purpose of the study was to recommend the prospective needs for municipal and industrial water supply which might be satisfied from the proposed Somerville Reservoir project, and to determine whether or not it is desirable (from the standpoints of economics and water quantity and quality) to meet these prospective needs from the Somerville project. Projections of future populations, industrial expansion, and water requirements were made for the entire lower Brazos River Basin. Consideration was also given to how the future water requirements of this area may best be met.

Descriptors: (*Skagit River Basin, *Reservoirs), (*Oregon, *Water resources), Forecasting.

The Corps of Engineers requested data on present municipal and industrial (M and I) water supply and water quality control needs in the Skagit River Basin, and on such future requirements as could be estimated within the scope of a reconnaissance study involving 19 possible reservoir sites. These data are to be used to determine the advisability of initiating detailed investigations of specific storage sites at a later time. The study area covered in this report consists of the portion of the Skagit River Basin in the United States, Whidbey Island, and the coastal sections of Skagit County. Evaluations include projected conditions to the year 2020, with interim points at 1980 and 2000. An economic base study was prepared for this purpose and is summarized in this report.

The purpose of the study was to estimate the water requirements for municipal and industrial and water quality control purposes in the Edwards Underground Reservoir area of Texas and the surrounding study area to the year 2075. Estimates are also made of the value of benefits attributable to the Federal reservoir projects which will provide storage of water for these purposes. In addition to determining requirements, an area-wide plan for supplying these needs is developed, which provides for orderly and efficient utilization of potential water resources within the area, and gives full recognition to all permits, commitments, and agreements executed by local interests.

Contract DI-14-12-405

Descriptors: (*Electrolytic cells, *Chemical removal (Sewage treatment)), (*Sewage treatment, Electrolytic cells), (*Phosphorus, Chemical removal (Sewage treatment)), Detergents.

Phosphates in waste water may be removed electrochemically utilizing sacrificial electrodes. The electrode metal is first dissolved by the flow of current then precipitates out, removing from solution the phosphate ions. This removal is either dependent on chemical reaction of the metal cation and the phosphate anions or, possibly, on the adsorption of the phosphate by the metal hydroxide floc. Data on the phosphate removal was gathered using both aluminum and iron electrodes. Essentially complete removal was found to occur on using 300 coulombs/liter of charge flow with normal phosphate concentrations for both types of electrodes. Treatment costs (excluding labor and filtration) have been estimated when using iron and aluminum electrodes respectively. Exploratory tests indicated that flotation by means of the hydrogen generated during the electrolysis may be used to remove suspended solids from raw sewage while phosphates are being removed. Extensive observation was made of refuse collection in urban residential areas in the city of Baltimore and its environs. All data were collected in the context of a classification of four neighborhood types of household densities. Three models were prepared in FORTRAN IV for simulation of refuse collection systems on an IBM 7094 computer. Data within the models can be easily changed so as to allow other cities' system characteristics to be substituted for the Baltimore data. (Author)

The data reflect the status, characteristics and types of disposal and treatment facilities in place on January 1, 1968. The inventory is the fifth to be taken on a national basis. Certain data from the statistical summaries of the previous inventories have been included in this publication to allow comparison with the 1968 inventory and to provide a measure of progress in the control and disposal of municipal wastes. Analyses of the data and of trends in the methods of collection, treatment and disposal of the wastes are included in the text.

Jamaica Bay, an estuary on the southern shore of Long Island and lying partly within New York City, is surrounded by densely populated areas. Because of property damage associated with extreme tides due to the close passage of large storms, consideration is being given to the construction of hurricane barriers to moderate the extreme storm surges. Since each hurricane barrier plan includes features which alter the natural hydraulic regime, it is possible that the water quality of the system may be altered by the implementation of any such plan. It is necessary as part of the initial study of possible schemes to evaluate the effects of each scheme on the water quality of the system. This report presents the results of the requested evaluation.

The Directory of Local Health and Mental Health Units has been compiled as of September 1, 1969, from data reported to the Health Services and Mental Health Administration by State health and mental health officers and directors of local health units. Information on local governmental mental health units is included. These units, reported by 23 states, are listed immediately after the local health units for each State. Units are grouped by type of organization and listed alphabetically within each type. The four types of organizations are (1) County; (2) City; (3) Local health district; and (4) State health district.

STATISTICAL SUMMARY OF WATER SUPPLY AND TREATMENT PRACTICES IN THE UNITED STATES,
John R. Thoman. 1953, 55p PHS-Pub-301

Descriptors: (*Water treatment, *United States), Inventories.

The report summarizes and discusses data on public water supply and treatment facilities in the United States based on the 1948 Inventory of Water and Sewage Facilities (unpublished). The data are presented in tables giving national summaries of source of supply and treatment, treatment plants, disinfection and selected unit processes. Detailed statistics by States, population groups, and geographical areas are given.

Descriptors: (*Food processing, *Industrial waste treatment), Lagoons (Ponds), Pilot plants, Potatoes, Aeration.
Identifiers: *Potato processing, *Water pollution control.

The report outlines the operation of and results from a pilot plant used to treat potato wastes from January 1 to June 1, 1967. Primary clarifier effluent was fed to the first of two small lagoons in series. The first lagoon was operated as a complete mixed anaerobic unit and the second lagoon was aerated with a small surface aerator. Hydraulic loadings were varied to give detention times of 8.8, 5.0, and 2.4 days in each lagoon.

Descriptors: (*Water analysis, *Nutrients), (*Water pollution, Nutrients), Silicon dioxide, Inorganic phosphates, Inorganic nitrates, Ammonia, Nitrogen organic compounds, Accuracy.

Nutrients in water are important because they promote biological responses that may interfere with some desired use of the water by man. Analysis of the various forms of these nutrients is routine in many laboratories, but the reliability of the results obtained has been questionable. This study evaluates the precision and accuracy of the commonly used analytical methods for the measurement of silica, phosphate, nitrate nitrogen, ammonia nitrogen, and organic nitrogen.

OIL SKIMMING DEVICES.
Clean water rept.

May 70, 92p

Descriptors: (*Water pollution, Oils), (*Skimmers, *Oils), Surveys.
Identifiers: *Oil pollution removal.

The document describes a number of different oil collection devices presently available, giving the manufacturer's name and other pertinent information on each method. In addition, some information covered by various patents on the subject of skimmers is also included. The skimming devices described in the report consist primarily of three different types: weir, drum and belt. The skimmers are classified as belonging to one of the major categories. The weir type uses the principle of overflowing a weir to separate the oil from the surrounding water, whereas the belt and drum types utilize the principle of selective adsorption of the oil from the water. In each category, skimmers have been listed in alphabetical order. No attempt has been made to determine the relative effectiveness of any of the skimming methods or to compare their merits. The equipment is described in as much detail as practicable from the information available. Additional data can be secured from the reference indicated, or by contacting the manufacturer or inventor directly.

MAHONING RIVER INVESTIGATION. EFFECTS ON WATER QUALITY OF PROPOSED MAHONING-GRAND RIVER DIVERSION. APPENDIX IV.
Jun 53, 21p

Descriptors: (*Mahoning River, *Reservoirs), (*Ohio, *Water resources), Stream flow, Water pollution, Flushing.

The report has been prepared at the request of the District Engineer, Corps of Engineers, Pittsburgh, Pennsylvania. Essentially, it is a re-evaluation of a previous report 'Effects on Water Quality of Proposed Mahoning-Grand River Diversion' prepared by the Public Health Service in December 1949. With respect to the requirements for organic pollution abatement, however, this whole problem has been restudied, using data obtained by the Ohio State Department of Health in a comprehensive stream sanitation study of the Mahoning River Basin extending over a period of several months (May to November, inclusive) in 1952. In addition, consideration has been given to reduction in industrial organic pollution which will result from waste treatment or plant process changes initiated primarily for the control of other types of pollution, such as suspended and floating solids and taste and odor producing substances.

Descriptors: (*Air filters, *Microorganisms), Filtration, Performance evaluation.

The authors of this monograph have been associated for several years with the problem of protecting personnel against disease-producing organisms found in hospitals or in biological laboratories. Although there are various means of cleaning air, the authors' experience has been widest in the use of air filtration as a method for removing bacteria from the air. This monograph is written for the specific purpose of making the benefits of this experience available to personnel such as architects, engineers, hospital administrators, and research investigators concerned with the control of pathogenic biological organisms. Although this report is oriented to biological air filtration, certainly the information also is applicable to industries using radioactive materials and to others, such as precision instrument industries or spacecraft projects that require physically clean air.

In a report by representatives of the Wisconsin State Board of Health on an investigation of an outbreak of gastroenteritis which occurred at Milwaukii in February, 1938, it was concluded, after reviewing extensive epidemiological evidence, that the outbreak was most probably water-borne and it was further recommended that a new standard of quality be adopted for chlorinated water supplies. This study proposes and recommends a new standard with special reference to its possible application to Milwaukee water, and reviews the laboratory results of examinations of this water.

Identifiers: *Gasbuggy operation.

The Southwestern Radiological Health Laboratory (SWRHL) provided off-site radiological surveillance support for Project Buggy I, conducted at the Nevada Test Site (NTS) at 0904 PST on March 12, 1968. The radioactive effluent released from this event traveled northward from the NTS and was detected in the environment as far north as Montana. The highest exposure rate observed off-site was 8.5 mR/hr measured during cloud passage at an unpopulated location approximately 80 miles from the point of detonation. The highest integrated exposure observed in the off-site area, as measured by thermoluminescent dosimeters, was 11.3 mR in the same unpopulated area. Thermoluminescent dosimeters located at populated areas indicated no external radiation exposures above background. These dosimeters were placed prior to the detonation to document the external radiation exposure from cloud passage plus 8 days of residual activity.

Off-site radiological surveillance was provided for the Gasbuggy-2 Redrill (GB-2R)-Phase 1 program. This surveillance was the continuation of the previous off-site surveillance program for Gasbuggy, and consisted of: operating a daily air sampling network; placing thermoluminescent dosimeters in a network around the site; monitoring for radioactivity; taking special air samples during flaring operations; and collecting water, vegetation, and soil samples after completion of testing operations. The only radioactivity above background levels detected off-site was in special air samples. These samples contained trititum concentrations above background; the concentrations found presented no hazard to and people or livestock living in the off-stie area. (Author)

The content of 144Ce, 137Cs, 131I, 239Pu, 106Ru, 95Zr, and 85Zn in rumen samples was measured. Grass exceeded 80% of the diet of 23 out of 43 monthly samples. Squirrel tail grass, Sitanion hystrix and Indian rice grass, Orhyzopsis hymenoides, were the major components of this portion of the diet. At times during the summer months Russian thistle constituted over 30% of the total diet. (Author Modified Abstract)

Hay bales were placed 30 to 50 miles from surface ground zero in the predicted downwind direction of the effluent from Project Schooner, conducted December 8, 1968. Subsequent to contamination, the hay was recovered and fed to groups of dairy cows in a controlled ingestion experiment. As noted in similar experiments during the Cabriolet and Buggy cratering tests, the secretion of 131I in milk was below expectations. Concurrent measurements of 187W transfer indicated that less than 0.07% of the ingested tungsten was secreted in milk.

Descriptors: (*Nuclear reactors, *Radioactive contaminants).
Identifiers: *NRX reactor.

The Public Health Service provided off-site surveillance in support of the NRX-A2 reactor tests conducted on September 24 and October 15, 1964. This support consisted of tracking the effluent, monitoring radiation dosage to the off-site population, and collecting environmental samples (air, milk, water and vegetation). Analyses of these data indicate that no hazard was created to the off site population from the NRX-A2 tests. (Author)

The Southwestern Radiological Health Laboratory provided off-site radiation surveillance in support of the Kiwi Transient Nuclear Test (TNT) conducted on January 12, 1965. This support consisted of tracking the effluent, monitoring radiation dosage to the off-site population and collecting environmental samples in southern Nevada and California. Although off-site contamination occurred as a result of Kiwi TNT, the data collected indicate that radioactivity levels did not exceed radiation Protection Guides established by the Atomic Energy Commission for the off-site population. OFF-SITE SURVEILLANCE ACTIVITIES OF THE SOUTHWESTERN RADIOLOGICAL HEALTH LABORATORY FROM JULY--DECEMBER 1964.

Dec 68, 43p

Descriptors: (*Nuclear explosions, *Radioactive contaminants).

Off-site radiological surveillance for fifteen announced underground nuclear detonations and four reactor experiments during the period from July through December 1964, at the Nevada Test Site is described. This surveillance was conducted in the public areas surrounding the Nevada Test Site. Off-site radiological surveillance was also provided for an underground test conducted in Mississippi as part of the Vela Uniform program. During the six-month period two announced nuclear events and four reactor experiments released radioactivity which was detected off-site. No radioactivity was released following the Project Salmon detonation in Mississippi. Analysis of all sampling and surveillance performed during the six-month period indicates that the safety criteria established by the Atomic Energy Commission for the off-site population were not exceeded. In conjunction with the Transient Nuclear Test of a Kiwi reactor, on January 12, 1965, hay contamination and controlled dairy cow ingestion studies for radioiodines were conducted. The studies were designed to simulate the maximum possible radioiodine uptake by dairy cows under winter dairy farming conditions, where radioiodines enter the cows via ingested, contaminated hay. The kinetics of the secretion of radioiodines in milk under the conditions of this experiment were determined.

Four groups of two lactating holstein cows each were dosed in single ingestion experiment with four different combinations of 126I and 131I ranging from 0 to 20.1% 126I. Theoretical equations developed and experimental results indicate that it is possible to detect and quantitate 126I in the presence of 131I in milk samples by determining the physical half-life of the combined radioiodines from repetitive gama scans on the same samples, even though the individual gama energies of 126I and 131I cannot be resolved by the gama analysis system. Peak levels of the radioiodines in milk from all cows were observed at five hours (first milking) after oral ingestion of dose.

Descriptors: (*Nuclear explosions, *Radioactive contaminants).
Identifiers: Dominic 2 operation.

Operation Dominic II was a series of four nuclear tests conducted on the Nevada Test Site between July 7 and 17, 1962. This report concerns the program of off-site radiological surveillance conducted throughout Operation Dominic II by the U. S. Public Health Service (PHS) for the Atomic Energy Commission (AEC) in accordance with a Memorandum of Understanding between the two agencies. The field and laboratory methods and equipment used, the measurements made, and the results obtained from off-site surveillance of the four events are described. No cases of alleged radiation sickness or injury to people, livestock, or property developed during the operation. The results of surveillance presented in this report indicate that the safety criteria established by the AEC for the off-site population were not exceeded during Operation Dominic II. (Author)

The off-site radiation surveillance for the NRX-A4/EST Project Rover Reactor test series which took place at NRDS test cell A is described. Of the six experimental plans in the test series, four resulted in detectable quantities of radioactivity in off-site areas. Although radioactive effluent was detected off-site from this event, the surveillance indicated that the radiation protection guides established by the Atomic Energy Commission (based on Federal Radiation Council guidelines), Chapter 0524, for the off-site population were not exceeded. The peak off-site potential thyroid exposure was about 36 milltrad at Lone Pine, California. (Author)

The Southwestern Radiological Health Laboratory provided off-site radiological surveillance for the NRX-A5 Project Rover Reactor Test Series at NRDS, Test Cell A. During the period in which this series was conducted, there were four experimental plans (EP's) in the NRX-A5 series, two of which were full power runs (1100 Mw) of about 15 minutes duration which produced detectable amounts of radioactivity off-site. Radioactive effluent released by the EP-III on June 8, 1966, was detected by ground level surveillance in the southwest off-site quadrant. Effluent released by the EP-IV on June 23 was detected by ground level surveillance to the Utah-Nevada border, about 190 miles from the Test Cell. Although off-site contamination occurred from the NRX-A5 test series, surveillance indicated that radioactivity levels did not exceed the radiation protection guides.

An experimental farm facility was required to determine the passage of 131I through air-forage-dairy cow-milk-man food chain. The following aspects of the experimental farm facility are described: specific site characteristics, cultivated area, well and reservoir, irrigation system, other agricultural equipment, laboratory and animal facilities, and permanent research and support equipment. Agronomy practices are discussed with regard to irrigation, crops, and fertilization. One experiment, Project Hayseed, was performed. An aerosol tagged with 131I was released over Sudan grass. The grass was cut and fed to groups of lactating cows.

The Southwestern Radiological Health Laboratory of the Public Health Service performed off-site radiological surveillance for ten announced events during the period from July through December 1966. This surveillance is conducted in the public areas surrounding the Nevada Test Site under a Memorandum of Understanding with the U.S. Atomic Energy Commission. No reactor experiments were conducted during this time. During the six-months period there was one event, Derringer,

conducted on September 12, 1966, which released radioactive effluent that was detected only in an unpopulated location off the Nevada Test Site. Also during this period an underground test, Project Sterling, was conducted in Mississippi on December 3, 1966 as part of the Vela Uniform program. No radioactivity attributable to this detonation was detected in the off-site area.

The mechanisms associated with the overall transfer of 131I from the environment to cow's milk were studied following the controlled release of a simulated fallout. A 131 I-labelled aerosol of submicrometer size was released over a pasture and a corral containing 18 dairy cows. Six of the cows had hay in mangers for their consumption. Another group of six was fed green chop from the contaminated pasture, while the remaining six cows received no other contaminated material. The pasture was contaminated to a level of 1.13 micro Ci/kg, and cows fed green chop from the pasture secreted a peak level of .07 micro Ci/liter in milk. The effects of feeding practices on the passage of 131I through the atmosphere-forage-cow-milk-man food chain were evaluated. (Author Modified Abstract)

Identifiers: *Pin Stripe shot.

A study was mounted at two dairy farms following the inadvertent release of radioactivity from the site of an underground nuclear test (Pin Stripe) conducted at the Nevada Test Site on April 25, 1966. The study produced some results which were similar to those found after the inadvertent release following the Pike event. At the two study farms the effective half-life of 131I was found to be 4.9 and 4.0 days for field forage while the green chop collected from the cow mangers had effective half-lives of 6.9 and 6.7 days, respectively. In the same order, the effective half-lives of 131I in milk from cows eating the green chop were 5.6 and 4.0 days. The milk-to-forage ratios (pCi/liter divided by pCi/kg) were 0.086 and 0.078, respectively,. In one of the herds, uncontaminated hay was substituted for contaminated fresh forage after the third day. Over an eighteen day period this countermeasure reduced the potential thyroid dose of humans consuming one liter of the milk per day to only 29% of the dose which would have resulted had no countermeasure been applied. Descriptors: (*Cattle, *Radioactive contaminants), (*Iodine isotopes, Cattle), (*Dairy cattle, *Radiobiology).
Identifiers: *Alfalfa operation.

The report covers the second controlled release conducted by the Bioenvironmental Research Program to define the mechanisms associated with the transfer of 131I from the environment to cow's milk. Growing alfalfa-oats, hay, and spread green chop were contaminated with a diatomaceous earth aerosol labelled with 131I. Three groups of dairy cows were fed the three types of contaminated forage. One other group of dairy cows was exposed directly to the aerosol for an air uptake study. The smaller particle size of the aerosol used in this study (2 micrometers) resulted in higher milk-to-forage ratios than were observed in the first study where the particle size was 23 micrometers. These ratios of peak average milk to peak average forage activities were 0.061 for the hay, 0.036 for the green chop, and 0.032 for the growing alfalfa-oats. (Author)

Project Rainout was an experiment conducted to determine the transfer of 131I from forage to dairy cow milk when the radioiodine was sprayed on the forage as an aqueous solution. Growing alfalfa, cut as green chop, and spread hay were used as forage. The peak activity in milk from cows consuming both types of forage occurred about one day after the start of feeding. The peak milk-to-peak forage ratio was 0.013 for the cows fed hay and 0.041 for the cows fed green chop. The hay fed cows secreted in milk an average of 4.5% of the amount of 131I they ingested, while the green chop fed cows secreted 6.1%. (Author)

FINAL REPORT OF OFF-SITE SURVEILLANCE FOR THE PHOEBUS IB, EP-I, EP-II, EP-III, EP-IV REACTOR TEST SERIES.

Jul 69, 30p

Descriptors: (*Nuclear rocket engines, *Radioactive contaminants).
Identifiers: *Rover operation, *Rocket reactors (Phoebus 1B).

The Phoebus 1B reactor test series consisted of three calibration operations and a full power run. Effluent from the Experimental Plan III (EP-III) operation was detected off-site by one ground monitor and by the presence of 29 pCi/cu m 139 Ba on a prefilter from a portable air sampler operating at an unpopulated location on Highway 95 in Nevada. Effluent from the Experimental Plan IV (EP-IV) operation was detected in air, milk, and vegetation samples and by portable and fixed radiac instruments in Nevada and Utah. The maximum concentration of 131I in milk was 63 pCi/l at the Martin Ranch southwest of Eureka, Nevada. No fresh fission products were found in water samples. In addition to the usual gaseous effluent from a reactor operation, the EP-IV operation resulted in the release of discrete particles of material that were found downwind as far as 80 miles from Test Cell 'C'. Only one particle was found beyond the Test Range Complex.

The report describes the extensive environmental monitoring system maintained by the Western Environmental Research Laboratory for nuclear testing programs in the United States. It is designed to produce comprehensive information and data on radioactive contamination and exposures as quickly as possible. This is accomplished through use of aircraft and mobile ground monitoring temas that can make radiation measurements and collect a variety of environmental samples, followed by specially designed laboratory analytical procedures and data processing to expedite data acquisition. The system can thereby provide rapid assessment of radioactive releases that may affect a large segment of the population within the western United States.

The SCHOONER Event, conducted at the Nevada Test Site, December 8, 1968, released radioactive effluent into the environment. Whole-body counts were performed on thirty one Public Health Service personnel who participated in this cratering experiment. Tungsten-187 appeared in the resultant spectra as the only contaminant. Repeated whole-body counts were performed during the week following exposure to determine the magnitude of individual burdens. The maximum burden measured, 25 micro Ci, correlates to an estimated dose to the large intestine of approximately 1 rad. A whole-body scan performed eight hours after exposure confirmed the presence of tungsten-187 in the GI tract of one individual.

Identifiers: *Rollercoaster operation.

Six bovine, three young animals and three aged animals, that were grazing on or near the 1963 Project Rollercoaster sites were sacrificed in April 1967 to assess the body burden of 239 Pu in these animals. Levels found in various tissues were higher than those found in bovine grazing on the NTS but far below the MPC levels established for humans. The maximum dose an individual could receive from consuming tissue from these animals is negligible. No pathology was found on either gross or microscopic examination that could be directly related to radiation. Due to the obscure etiology of the described lesions, it would be impossible to reach any definte conclusions as to their origin; but it would appear to be due to some other cause than radiation, since the body burden of 239 Pu was well below those levels known to induce detectable radiation damage. No statisical difference was found in the levels of 239 Pu between the young and aged animals. Hilaria jamesii constituted 86% of the animals' diet. (Author)

A protective measure applied to decrease radioiodines in a dairy's milk production and the factors judged in choosing the mode of action are defined. On April 25, 1966, an underground nuclear test conducted at the Nevada Test Site released radioactivity to the atmosphere. Four cows were fed a regular diet of green chop and grain as a control to assess the effect of protective action. The 131I levels in their milk decreased only about 10% per day. Protective action consisted of feeding the remaining cows dry hay and grain. It was estimated that this action reduced the 131I thyroid dose by 71%.

The Public Health Service provided off-site surveillance in support of the Pin Stripe Event conducted on April 25, 1966, at the Nevada Test Site. This support consisted of tracking the effluent, monitoring radiation dosage to the off-site population, collecting and analyzing environmental samples of air, milk, water and vegetation, and conducting an intensive public relations program for the off-site residents.

OFF-SITE SURVEILLANCE FOR PROJECT LONGSHOT.
Final report.

Dec 68, 8p

Descriptors: (*Nuclear explosions, *Radioactive contaminants), (*Amchitka Island, Nuclear explosions).
Identifiers: Longshot operation.

The program of radiation monitoring and environmental sampling conducted in conjunction with Project Longshot, an underground nuclear experiment which took place on Amchitka Island in the Aleutian Chain, on October 29, 1965, is described and the results tabulated. It was concluded that all radioactivity was completely contained during Project Longshot, and that the experiment produced no radioactive exposure of any off-site resident.

Descriptors: (*Nuclear rocket engines, *Radioactive contaminants).
Identifiers: *Rover operation, *Rocket reactors (Phoebus 2A).

The Phoebus 2A Experimental Plans IV and V were full-power nuclear reactor operations conducted as part of Project Rover. Large effluent particles of high activity were studied for particle depostion concentration at various distances, gross physical characteristics, chemical composition, and gross and specific radioactivity. Survey results indicated wide spread deposition for Plan IV with no defined hotline. The particles were porous and fragile and had a metallic black appearance. The use of a latex spray reduced the shattering of particles during collection and separation. The chemical composition of the particles was primarily uranium oxides. Fall velocity was determined. The primary radioisotopes found by gamma spectroscopy were those of Sr, Zr, Ru, I, Ba, Mo, and Ce. (Author Modified Abstract)

Descriptors: (*Nuclear explosions, *Radioactive contaminants).
Identifiers: *Gasbuggy operation.

The Southwestern Radiological Health Laboratory of the Public Health Service performed off-site radiological surveillance for twelve announced events and one reactor experiment during the period from July through December 1967. This surveillance was conducted in the public areas surrounding the Nevada Test Site (NTS). Off-site radiological surveillance was provided for Project Gasbuggy, an underground gas stimulation project conducted in New Mexico on December 10, 1967. During the six-month period, one announced nuclear event, the Door Mist Event, and one experimental plan, EP-IIIA, of the NRX-A6 reactor test series released radioactivity which was detected off-site.

Descriptors: (*Pahranagat Lake, *Radioactive contaminants).

Results of a three-month preliminary radiation surveillance study of an aquatic system in Upper Pahranagat Lake near the Nevada Test Site are presented. The study was conducted to determine the concentrations of fission products in selected samples and to establish the necessary methodology for radiation surveillance in an aquatic ecosystem. Radionuclide concentrations were found to be insignificant in water, aquatic plant, and fish samples. sediment samples had detectable levels of 137Cs, 40K, 90Sr, and U.

From June 1, 1964 to June 1, 1969, the Atomic Energy Commission's (AEC) beef herd has been maintained on the Nevada Test Site (NTS) by the Public Health Service's Southwestern Radiological Health Laboratory (SWRHL). The herd is used to determine the uptake and retention of various radionuclides and to provide background information regarding various inquiries and possible legal claims from off-site ranchers. The history, animal husbandry, production, and sampling program for the herd during the last five years are reviewed. Data are presented on the content of various radioisotpes in selected tissue samples and their relation to plant species ingested during grazing.

Baled hay was placed on the ground in the predicted trajectory of the effluent from the two Plowshare cratering tests, Cabriolet and Buggy. After contamination, the bales were collected and measured amounts of the hay were fed to groups of dairy cows. As compared to similar experiments following other cratering tests, the amount of 131I transferred to milk was about one-third, and the time to peak milk concentration and effective half-life in milk were longer. The ratio of peak 131I concentration in milk to the peak concentration in hay was also much less than that observed in previous tests. These facts suggest that the 131I in the debris from these two tests was less biologically available to the cow than it was in previous tests. For Project Buggy, the transfer of 187W to milk was also measured.

Identifiers: *Rover operation, *Rocket reactor (PEWEE).

Radiological monitoring and sampling were conducted in off-site areas after the testing of the Pewee 1 reactor through Experimental Plans (EP's) II and III, conducted on November 21 and December 4, respectively, at Test Cell C, Nuclear Rocket Development Station. No radioactivity was released during Experimental Plan I. The radioactive effluent from EP III was found by aircraft and off-site surveillance to have moved east-southeast from the test area as far as northwestern New Mexico. Air samples which contained reactor-related radioactivity were collected in southeastern Nevada, southern Utah, southwestern Colorado, northern Arizona, and northwestern New Mexico. Emissions from reactor pulse-cool-down operations and possibly portions of the main reactor cloud transported south by the evening drainage winds were also detected by air samplers located in southeastern California and Nevada.

SUMMARY OF HYPOTHETICAL WHOLE-BODY GAMMA EXPOSURES AND INFANT THYROID DOSES RESULTING OFF-SITE FROM PROJECT ROVER NUCLEAR REACTOR/ENGINE TESTS AT THE NUCLEAR ROCKET DEVELOPMENT STATION,

Descriptors: (*Nuclear rocket engines, *Radiation dosage), Whole body irradiation.
Identifiers: *Rover operation.

From 1959 through 1969, thirty-one nuclear reactor engine tests, conducted at the Nuclear Rocket Development Station (NRDS) as part of Project Rover, released airborne radioactivity which was detected in the area surrounding the Test Range Complex (NRDS, Nevada Test Site, Tonopah Test Range, and Nellis Air Force Range). For these tests the Southwestern Radiological Health Laboratory (SWRHL) performed radiological monitoring and sampling. From the radiation exposure information reported by SWRHL, whole-body gamma exposures and infant thyroid doses were postulated for hypothetical receptors and summarized by year and sector from NRDS. A comparison of the Radiation Protection Standards of AEC Manual Chapter 0524 with this summary indicated that for each year of testing, the off-site whole-body exposures and infant thyroid doses were below 12% and 14%, respectively, of the Radiation Protection Standards for a population sample. Data obtained from two concurrent dosimetry networks operated by the Western Environmental Research Laboratory in Nevada, one utilizing fim badges and the other, thermoluminescent dosimeters (TLD's), are compared. Gamma exposures from a few mR to approximately 1 R, due to both natural background and fission products in the environment, are more easily and accurately measured by the TLD system. The insensitivity of TLD's to environmental heating, humidity, light damage, and pressure makes them ideal for use in the extreme conditions encountered in the desert. Heat damage to the film was seasonal with the greatest losses occurring in the summer.

Project Rulison is a PLOWSHARE EXPERIMENT TO INVESTIGATE THE FEASIBILITY OF NUCLEAR EXPLOSIVE STIMULATION OF NATURAL GAS PRODUCTION. The detonation of the explosive took place on September 10, 1969. Production testing activities will be initiated six months or more after the detonation and will entail flaring of natural gas containing radioactivity. The radionuclides of primary interest that will be released by production testing are tritium and 85Kr. An analysis of the public health implications of the radioactivity releases associated with Project Rulison production testing is presented.

Descriptors: (*Nuclear explosions, *Radioactive contaminants).

During the period January through June 1969, eleven announced nuclear detonations were conducted at the Atomic Energy Commission's Nevada Test Site. None of these events released radioactive material that was detected off-site. One power run of a nuclear reactor rocket engine at the Nuclear Rocket Development Station on June 11, 1969, released gaseous fission products that were detected on one air sampler at the Diablo Highway Maintenance Station on Highway 25. The concentration of 131I, determined from the combined results of the particulate and charcoal filters from this location, was 0.7 pCi/cu m. Some radioactive material from Project Schooner of December 8, 1968, was resuspended from material deposited on and off-site. This material was occasionally found on air samples through March 1969. No domestic water or milk samples collected during this period contained fresh fission products. Exposure to the off-site population during this period was well below the safety criteria established by the Atomic Energy Commission. (Author)

During the period July through December 1969, fifteen announced underground nuclear tests were conducted by the U. S. Atomic Energy Commission at the Nevada Test Site, and two events, Project Rulison and Project Milrow, were conducted in Colorado and Alaska. One event, Pod, conducted on October 29, 1969, was detected by GM survey instruments only at Lathrop Wells, Nevada. The peak reading was 0.04 mR/hr net gamma. One power run of the XE-Prime nuclear rocket engine did release radioactivity to the off-site areas. The maximum gross gamma exposure rate measured by portable survey instruments was 0.04 mR/hr. The maximum integrated concentration of 131I on an air sample was 0.45 micro Ci-sec/cu m. No milk or domestic water sampled showed fresh fission products. All off-site exposures were well below the safety criteria established by the Atomic Energy Commission. (Author)

Descriptors: (*Nuclear explosions, *Radioactive contaminants).
Identifiers: *Gasbuggy operation.

The Southwestern Radiological Health Laboratory (SWRHL) began off-site radiological safety operations for Project Gasbuggy in June 1967. A census was taken during the following three months of all people and milk cows within 100 miles of the Gasbuggy site. All mining and tunneling operations within 50 miles were also located. The collection of environmental samples to establish background levels of radioactivity was started in early August 1967, when milk and water samples were collected. Vegetation samples for background information were collected in early December 1967. Milk and water samples were collected following the shot and the drill-back operations to find if radiation levels had increased.

SUBJECT INDEX

ABANDONED COAL MINES
Detection of Abandoned Underground Coal Mines by Geophysical Methods.
PB-211 554 8I

SEALING
Evaluation of Shavers Fork Mine Seals,
PB-213 705/7 8I

ABSORBENTS
MAGNESIUM CARBONATES
Magnesia Base Wet Scrubbing of Pulverized Coal Generated Flue Gas - Pilot Demonstration,
PB-198 075 7A

ABSORBERS (EQUIPMENT)
Evaluation of Operating Parameters of Alumina Columns for the Selective Removal of Phosphorus from Waste-Waters and the Ultimate Disposal of Phosphorus as Calcium Phosphate,
PB-189 405 7A

CYCLIC LOADS
Cyclic Operation of Plate Columns for Gas-Liquid Contacting.
PB-211 853 7A

OILS
Floating Oil Recovery Device.
PB-213 441/9 13B

A Free Floating Endless Belt Oil Skimmer,
PB-214 103/4 13B

SEWAGE TREATMENT
Carbon Column Operation in Waste Water Treatment,
PB-202 579 7A

ABSORBERS (MATERIALS)
OILS
Use of Chemicals to Treat Oil on Water.
PB-215 084 13B

ABSORPTION
HYDROGEN SULFIDE
Sewage Odor Control by Liquid-Gas Extraction.
PB-209 641 7A

ABSTRACTS
SURFACE WATER RUNOFF
Selected Urban Storm Water Runoff Abstracts.
PB-198 229 8H

Selected Urban Storm Water Runoff Abstracts.
PB-198 312 8H

VIRUSES
Viruses in Waste, Renovated, and Other Waters. 1971 Literature Abstracts,
PB-213 476/5 6M

ACCIDENTS
ELECTRICAL SHOCK
Demonstration Guide for Prevention of Electric Shock Injury.
PB-217 672 13L

ACCOUNTING
INCINERATORS

TOXICOLOGY
Aice Survey of USSR Air Pollution Literature. Volume XV. A Third Compilation of Technical Reports on the Biological Effects and the Public Health Aspects of Atmospheric Pollutants,
PB-211 074 13B

ACTIVATED CARBON
DEWATERING
Ultrafiltrative Dewatering of Spent Powdered Carbon.
PB-197 865 13B

GAS SAMPLING
A Non-Selective Collector for Sampling Gaseous Air Pollutants.
PB-215 302 13B

INDUSTRIAL WASTE TREATMENT
An Investigation of Techniques for Removal of Cyanide from Electroplating Wastes.
PB-208 210 13B

POROSITY
Effect of Porous Structure on Carbon Activation.
PB-210 145 7A

REGENERATION (ENGINEERING)
The Development of a Fluidized-Bed Technique for the Regeneration of Powdered Activated Carbon.
PB-197 892 7A

Optimization of the Regeneration Procedure for Granular Activated Carbon.
PB-208 205 7A

Thermal Regeneration of Spent Powdered Carbon Using Fluidized-Bed and Transport Reactors,
PB-216 352 13B

WATER ANALYSIS

ALUMINUM CHLORIDE HYDROXIDES
Phosphorus Removal with Aluminum Chlorohydrate,
PB-216 838 13B

ALUMINUM HYDROXIDES
DEWATERING
Natural Freezing for Dewatering of Aluminum Hydroxide Sludges,
PB-218 505 13B

ALUMINUM INDUSTRY
WATER POLLUTION
Disposal of Solid Aluminum Process Wastes in the Ocean,
PB-210 116 13B

ALUMINUM OXIDE
SORBENTS
Removal of SO2 From Power Plant Flue Gases Using the Alkalized Alumina Process. Phases I and II. Data Evaluation Preliminary Process Design, Optimization, and Economics.
PB-200 881 7A

ALUMINUM OXIDES
ADSORBENTS
Mobile Pilot Plant for Removal of Phosphate from Wastewaters by Adsorption on Alumina.
PB-212 374 13B

ALUMS
CHEMICAL REMOVAL (SEWAGE TREATMENT)
Soluble Phosphorus in the Activated Sludge Process. Part I. Chemical-Biological Process Performance.
PB-211 563 13B

PRODUCTION CAPACITY
Cost and Supply Analysis for Alum and Methanol Used in Wastewater Treatment,
PB-213 779/8 13B

SEWAGE TREATMENT
Phosphorus Removal Using Chemical Coagulation and a Continuous Countercurrent Filtration Process.
PB-196 734 13B

Combined Biological and Chemical Treatment for Phosphorus Removal,
PB-217 405 13B

Alum Addition to Activated Sludge with Tertiary Solids Removal,
PB-217 444 13B

Removal of Phosphate from Wastewater by Aluminum Salts with Subsequent Aluminum Recovery,
PB-217 699 13B

AMCHITKA ISLAND
NUCLEAR EXPLOSIONS
Off-Site Surveillance for Project Longshot.
SWRHL-6-r 18H

Final Report of Off-Site Surveillance for the Milrow Event, October 2, 1969.
SWRHL-95-r 18H

AMERICAN RIVER BASIN
WATER RESOURCES
Water Quality Control Study. American River - Tahoe Basin Diversions California. A Preliminary Evaluation of Effects on Water Quality and Water Use.
PB-217 065 13B

AMIDINES
ANION EXCHANGING
Nitrate Removal from Wastewaters by Ion Exchange.
PB-204 527 13B

AMINAL DISEASES
POULTRY
Poultry Hygiene. Part 1. Examination and Evaluation of Poultry and Poultry Products.
PB-216 151 21

AMINES
CHROMATOGRAPHIC ANALYSIS
The Identification of Aliphatic Amines in Air as Their Benzamides by Paper Chromatography,
PB-216 846 7C

COLORIMETRIC ANALYSIS
Spot Test Detection and Colorimetric Determination of Aniline, Naphthylamine and Anthramine Derivatives with 4-Azobenzenediazonium Fluoborate,
PB-215 230 7C

Spectrophotometric Determination of 4-Aminoazobenzenes, 4-Aminostilbenes, Schiff Bases, and Analogous Compounds with 3-Methyl-2-Benzothiazolone Hydrazone,
PB-215 364 7C

DIAZOTIZATION
Spot Test Detection and Colorimetric Determination of Aniline, Naphthylamine and Anthramine Derivatives with 4-Azobenzenediazonium Fluoborate,
PB-215 230 7C

AMINO ACIDS
SLUDGE DIGESTION
Uptake and Utilization of Amino Acids During Anaerobic Digestion.
PB-217 255 6M

AMMONIA
ADSORBENTS
Applicability of Aqueous Solutions to the Removal of SO2 From Flue Gases. Volume I.
PB-196 780 7A

Sulfur Oxide Removal From Power Plant Stack Gas. Ammonia Scrubbing: Production of Ammonium Sulfate and Use as an Intermediate in Phosphate Fertilizer Manufacture.
PB-196 804 7A

AIR POLLUTION
Air Pollution Aspects of Ammonia.
PB-188 082 13B

Aice Survey of USSR Air Pollution Literature. Volume XI. A Second Compilation of Technical Reports on the Biological Effects and the Public Health Aspects of Atmospheric Pollutants,
PB-209 478 13B

CHEMICAL REMOVAL (SEWAGE TREATMENT)
The Electro-Oxidation of Ammonia in Sewage to Nitrogen.
PB-204 526 13B

Optimization of Ammonia Removal by Ion Exchange Using Clinoptilolite.
PB-211 605 13B

Ammonia Removal in a Physical-Chemical Wastewater Treatment Process.
PB-214 531/6 13B

Physical-Chemical Nitrogen Removal from Municipal Wastewater,
PB-214 563/9 13B

Nitrogen Removal by Breakpoint Chlorination,
PB-217 292 13B

GAS DETECTORS
Field Study on Application of Laser Coincidence Absorption Measurement Techniques.
PB-210 671 13B

INDUSTRIAL WASTE TREATMENT
Design of Ammonia Stripping Towers for Wastewater Treatment,
PB-217 281 7A

ION EXCHANGING
Wastewater Ammonia Removal by Ion Exchange.
PB-209 934 13B

SEWAGE TREATMENT
Design of Ammonia Stripping Towers for Wastewater Treatment,
PB-217 281 7A

WATER CHEMISTRY
Present Status of Chemistry of Chlorine and Ammonia-Chlorine Treatment of Water,
PB-216 932 7B

AMMONIA STRIPPING
Design of Ammonia Stripping Towers for Wastewater Treatment,
PB-217 281 7A

AMMONIUM COMPOUNDS
BACTERICIDES
The Germicidal Efficiency of Silver, Iodine, and Quaternary Ammonium Compounds,
PB-215 369 13B

AMMONIUM MAGNESIUM PHOSPHATE
Ultimate Disposal of Phosphate from Waste Water by Recovery as Fertilizer.
PB-196 739 13B

AMMONIUM QUATERNARY SALTS
FLOCCULANTS
Investigation of Amphipathic Water-Soluble Polymers as Flocculants and Flotation Aids in Domestic Wastewater Treatment,
PB-217 985 13B

AMMONIUM SULFATE
MATERIALS RECOVERY
Sulfur Oxide Removal From Power Plant Stack Gas. Ammonia Scrubbing: Production of Ammonium Sulfate and Use as an Intermediate in Phosphate Fertilizer Manufacture.
PB-196 804 7A

ANAERROBIC BACTERIA
COUNTING
Development of Techniques for Estimating the Bacterial Population of Sewage Sludge.
PB-211 246 13B

SEWAGE TREATMENT
Controlling Factors in Methane Fermentation.
PB-206 237 7A

ANAERROBIC LAGOONS
Aerated Lagoons for Potato Processing Wastes,
PB-217 989 13B

ANAERROBIC PONDS
International Symposium for Waste Treatment Lagoons (2nd) Held in Kansas City, Mo., 23-25 Jun 70,
PB-215 600 13B

ANAERROBIC PROCESSES
AQUATIC MICROBIOLOGY
Microbiology of Anaerobic Sludge.
PB-215 362 13B

CHEMICAL REMOVAL (WATER TREATMENT)
Denitrification by Anaerobic Filters and Ponds.
PB-213 719/1 13B

The Anaerobic Filter for the Denitrification of Agricultural Subsurface Drainage,
PB-216 688 13B

INDUSTRIAL WASTE TREATMENT
Anaerobic Treatment of Synthetic Organic Wastes,
PB-211 130 13B

INHIBITORS
The Effects of Sulfides on Anaerobic Treatment,
PB-217 961 13B

METABOLISM
The Biochemistry of Anaerobic Digestion.
PB-198 655 13B

Uptake and Utilization of Amino Acids During Anaerobic Digestion.
PB-217 255 6M

MICROBIOLOGY
Microbiology of Anaerobic Sludge.
PB-216 741 13B

Kinetics of Hydrogen Assimilation in Methane Fermentation,
PB-217 394 6M

MICROORGANISM CONTROL (SEWAGE)
Cation Toxicity and Stimulation in Anaerobic Waste Treatment. II: Daily Feed Studies,
PB-215 390 13B

POISONS
The Role of Sulfide in Preventing Heavy Metal Toxicity in Anaerobic Treatment,
PB-215 188 13B

Ion Effects in 'Anaerobic Digestion'.
PB-215 281 13B

PROCESS VARIABLES
Controlling Factors in Methane Fermentation.
PB-216 556 13B

Studies on the Methanogenic Bacteria in Sludge.
PB-217 438 13B

REACTION KINETICS
Thermokinetics in Anaerobic Digestion.
PB-214 929 13B

SEWAGE TREATMENT
Nutrient Requirements and Biological Solids Accumulation in Anaerobic Digestion,
PB-214 925 13B

Suburban Sewage Treatment by the Anaerobic Contact Process,
PB-215 018 13B

Chemical and Hydraulic Characteristics of the Anaerobic Contact Process for Sewage Treatment,
PB-216 540 13B

WASTE DISPOSAL
Comprehensive Studies of Solid Waste Management.
PB-213 576/3 13B

ANILINE/N-N-DIMETHYL
Applicability of Reduction to Sulfur Techniques to the Development of New Processes for Removing SO2 from Flue Gases. Volume II.
PB-198 408 7A

ANILINE/PHENYLAZO
Spectrophotometric Determination of 4-Aminoazobenzenes, 4-Aminostilbenes, Schiff Bases, and Analogous Compounds with 3-Methyl-2-Benzothiazolone Hydrazone,
PB-215 364 7C

ANILINES
ADSORBENTS
Applicability of Reduction to Sulfur Techniques to the Development of New Processes for Removing SO2 from Flue Gases. Volume II.
PB-198 408 7A

COLORIMETRIC ANALYSIS
Spot Test Detection and Colorimetric Determination of Aniline, Naphthylamine and Anthramine Derivatives with 4-Azobenzenediazonium Fluoborate,
PB-215 230 7C

ANIMAS RIVER
WATER POLLUTION
Survey of Interstate Pollution of the Animas River (Colorado-New Mexico),
PB-214 921 13B

ANION EXCHANGING
AMIDINES
Nitrate Removal from Wastewaters by Ion Exchange.
PB-204 527 13B

ANNAPOLIS (MARYLAND)
Immediate Water Pollution Control Needs. Central Western Shore of Chesapeake Bay Area (Magothy, Severn, South, and West River Drainage Areas).
PB-217 720 13B

Water Quality Survey of Chesapeake Bay in the Vicinity of Annapolis, Maryland.
PB-217 939 13B

ANNE ARUNDEL COUNTY (MARYLAND)
Immediate Water Pollution Control Needs. Central Western Shore of Chesapeake Bay Area (Magothy, Severn, South, and West River Drainage Areas).
PB-217 720 13B

ANTENNAS
INVENTORY
A Partial Inventory of Microwave Towers, Broadcasting Transmitters, and Fixed Radar by States and Regions.
PB-193 542 6R

ANTIBODIES
INSECTICIDES
Water Monitoring System.
PB-203 426 6A

ANTICYCLONES
AIR POLLUTION
Climatology of Stagnating Anticyclones East of the Rocky Mountains, 1936-1965,
PB-174 709 4B

CLIMATOLOGY
Synoptic Climatology of Stagnating Anticyclones East of the Rocky Mountains in the United States for the Period 1936-1956.
PB-216 593 4B

ANTIETAM CREEK
BIOLOGICAL SURVEYS
Biological Survey of Antietam Creek and Some of Its Tributaries, From Waynesboro, Pennsylvania to Antietam, Maryland. Potomac River Basin.
PB-217 929 6F

ANTIGEN ANTIBODY REACTIONS
WATER ANALYSIS
Water Monitoring System.
PB-203 426 6A

ANTIKNOCK ADDITIVES
TAXES
Tax Systems to Support Reduction of Lead Content in Motor Gasolines.
PB-203 953 13B

ANTIPYRINE/AMINO
Factors Influencing the Condensation of 4-Aminoantipyrine with Phenols,
PB-215 096 7C

APARTMENT BUILDINGS
REFUSE DISPOSAL
Collection, Reduction, and Disposal of Solid Waste in High-Rise Multifamily Dwellings.
PB-197 623 13B

AQUACULTURE
INDUSTRIAL WASTE TREATMENT
An Evaluation of Salmonid Hatchery Wastes,
PB-215 497 13B

AQUATIC ANIMALS
BENTHOS
Benthonic Invertebrates as an Index of Water Quality.
PB-216 847 6F

INVERTEBRATES
References for the Identification of Freshwater Macroinvertebrates.
PB-213 379/1 6C

SIEVES
A New Multiple Sieve Design for Screening Bottom Samples,
PB-214 923 6C

WATER POLLUTION
Chemical Responses by Marine Organisms to Stress. Stress in Hard Clams from a Polluted Estuary,
PB-213 193/6 8A

Animal Infestations in Distribution Systems,
PB-214 999 6C

Toxicant-Induced Behavioral and Histological Pathology. A Auantitative Study of Sublethal Toxication in the Aquatic Environment.
PB-215 668 6T

WORMS
The Resistance of Tubificid Worms to Three Common Pollutants,
PB-217 703 13B

AQUATIC BIOLOGY
DDT
Formal Discussion of Paper I-3, Impact on Salmon of Spraying Insecticide Over Forests by P. F. Elson and C. J. Kerswill, Pub. In Proceedings of the International Conference (3rd), Held in Munich, Germany, 5-9 September 1967, P70-72,
PB-218 512 6F

ECOLOGY

POWDER RIVER BASIN
WATER POLLUTION
Water Quality Control Study. Powder River Basin, Kaycee Unit, Wyoming.
PB-215 598 13B

POWELL COUNTY (MONTANA)
Powell County, Montana Air Pollution Abatement Activity. Pre-Conference Investigations.
PB-215 483 13B

POWER METERS
MICROWAVES
A Comparison of Microwave Detection Instruments,
PB-191 395 14B

Development of Liquid Crystal Microwave Power Density Meter.
PB-191 396 14B

POWER PLANTS (ESTABLISHMENTS)
AIR POLLUTION
Abatement of Sulfur Oxide Emissions from Stationary Combustion Sources.
PB-192 887 13B

WASTE GASES
Potential Dispersion of Plumes from Large Power Plants.
PB-168 790 13B

Emissions from Coal-Fired Power Plants: A Comprehensive Summary,
PB-174 708 13B

PRECIPITATION (CHEMISTRY)
PHOSPHORUS
Evaluation of Processes Available for Removal of Phosphorus from Wastewater.
PB-211 191 13B

Phosphorus Removal with Aluminum Chlorohydrate,
PB-216 838 13B

Lime Precipitation in Municipal Wastewaters,
PB-217 626 13B

PHOSPHORUS INORGANIC ACIDS
Phosphorus Removal Using Chemical Coagulation and a Continuous Countercurrent Filtration Process.
PB-196 734 13B

Kinetics and Mechanism of Precipitation and Nature of the Precipitatie Obtained in Phosphate Removal from Waste Water Using Aluminum (III) and Iron (III) Salts.
PB-196 737 13B

Phosphate Removal from Waste Waters Using Lanthanum Precipitation.
PB-196 738 13B

Ultimate Disposal of Phosphate from Waste Water by Recovery as Fertilizer.
PB-196 739 13B

SEWAGE TREATMENT
Phosphorous Removal by Ferrous Iron and Lime.
PB-208 208 13B

PRECIPITATION (METEOROLOGY)
AIR POLLUTION
Long-Term Effects on Air Pollution - a Survey,
PB-193 801 13B

Field Investigation of Sulfur Dioxide Washout from the Plume of a Large Coal-Fired Power Plant by Natural Precipitation.
PB-203 129 13B

PRECIPITATION (METEROLOGY)
Natural Precipitation Washout of Sulfur Dioxide,
PB-210 968 13B

PRECIPITATION WASHOUT
Field Investigation of Sulfur Dioxide Washout from the Plume of a Large Coal-Fired Power Plant by Natural Precipitation.
PB-203 129 13B

Natural Precipitation Washout of Sulfur Dioxide,
PB-210 968 13B

Radioactive Fallout in Rain in the Cincinnati Area,
PB-215 337 8H

SWRHL-50-r — 18H

Off-Site Radiological Surveillance, Nimbus B-2/Snap-19 Launch, April 13, 1969.
SWRHL-71-r — 18H

ROCKET REACTOR (PEWEE)
Environmental Surveillance for Pewee 1, Experimental Plans II and III, November 21 and December 4, 1968.
SWRHL-87-r — 18H

ROCKET REACTORS (KIWI)
Final Report of Off-Site Surveillance for the Kiwi B4D Experiment.
SWRHL-7-r — 18H

Final Report of Off-Site Surveillance for the Kiwi B4E Experiment.
SWRHL-15-r — 18H

Final Report of Off-Site Surveillance for the Kiwi TNT Experiment.
SWRHL-17-r — 18H

Radioiodine Studies Following the Transient Nuclear Test (TNT) of a Kiwi Reactor.
SWRHL-26-r — 18H

ROCKET REACTORS (NERVA)
Final Report of Off-Site Surveillance for the Nrx-A6 Reactor Tests Series.
SWRHL-78-r — 18H

ROCKET REACTORS (PHOEBUS 1A)
Final Report of Off-Site Surveillance for the Phoebus 1-a Experiment.
SWRHL-19-r — 18H

ROCKET REACTORS (PHOEBUS 1B)
Final Report of Off-Site Surveillance for the Phoebus Ib, Ep-I, Ep-II, Ep-III, Ep-IV Reactor Test Series.
SWRHL-45-r — 18H

Particulate Effluent Study. Phoebus 1B, Ep-IV.
SWRHL-46-r — 18H

ROCKET REACTORS (PHOEBUS 2A)
Particulate Effluent Study. Phoebus 2A: Ep-Iv and Ep-V.
SWRHL-60-r — 18H

Final Report of Environmental Surveillance for Phoebus 2A Reactor Test Series, May-July 1968.
SWRHL-72-r — 18H

SWRHL-30-r — 18H

Final Report of Off-Site Surveillance for the Nrx-A3 Test Series.
SWRHL-32-r — 18H

Final Report of Off-Site Surveillance for the Phoebus Ib, Ep-I, Ep-II, Ep-III, Ep-IV Reactor Test Series.
SWRHL-45-r — 18H

Particulate Effluent Study. Phoebus 1B, Ep-IV.
SWRHL-46-r — 18H

Particulate Effluent Study. Phoebus 2A: Ep-Iv and Ep-V.
SWRHL-60-r — 18H

Final Report of Environmental Surveillance for Phoebus 2A Reactor Test Series, May-July 1968.
SWRHL-72-r — 18H

Environmental Surveillance for Pewee 1, Experimental Plans II and III, November 21 and December 4, 1968.
SWRHL-87-r — 18H

Summary of Hypothetical Whole-Body Gamma Exposures and Infant Thyroid Doses Resulting Off-Site from Project Rover Nuclear Reactor/Engine Tests at the Nuclear Rocket Development Station,
SWRHL-92-r — 6R

RUBBER INDUSTRY
INDUSTRIAL WASTE TREATMENT
Fluidized-Bed Incineration of Selected Carbonaceous Industrial Wastes.
PB-211 161 — 13B

WASTE DISPOSAL
Rubber Reuse and Solid Waste Management. Part I. Solid Waste Management in the Fabricated Rubber Products Industry, 1968. Part II. Waste Rubber and Its Reuse, 1968,
PB-203 619 — 13B

RULISON OPERATION
Off-Site Radiological Safety and Resident Evacuation Program for Project Rulison.
SWRHL-94-r — 18H

Public Health Evaluation, Project Rulison (Production Testing),
SWRHL-96 — 18H

RUMINANTS
CALCIUM
Calcium in Hock Joints of Wildlife Ruminants in Selected Areas of the United States.
SWRHL-34-r — 6C

WATER POLLUTION
The Economics of Clean Water. Volume II. Animal Wastes Profile.
PB-218 493 — 13B

RUNNING WATER DRAW
WATER RESOURCES
Water Resources Study. Running Water Draw Watershed, Brazos River Basin, Texas and New Mexico.
PB-214 995 — 13B

RURAL AREAS
AIR POLLUTION
Air Quality Data from the National Air Surveillance Networks and Contributing State and Local Networks 1966 Edition.
PB-195 155 — 13B

Air Quality Data for 1967 from the National Air Surveillance Networks (Revised 1971).

SPARTANBURG (SOUTH CAROLINA)
An Appraisal of Air Pollution in Spartanburg, South Carolina,
PB-217 151 13B

SPECTROCHEMICAL ANALYSIS
MERCURY
Monitoring Mercury Vapor Near Pollution Sites.
PB-212 370 13B

PARTICLES
Development of X-Ray Fluorescence Spectroscopy for Elemental Analysis of Particulate Matter in the Atmosphere and in Source Emissions,
PB-213 366/8 7D

TRACE ELEMENTS
Water Metals No. 4, Study Number 30. Report of a Study Conducted by Analytical Reference Service.
PB-215 673 13B

SPECTROSCOPIC ANALYSIS
Fluorescent Probes in the Development of New Analytical Methods for Detection of Water Pollution.
PB-191 812 7D

ALDEHYDES
Detection of Aromatic Aldehydes.
PB-216 696 7C

ALKENE HYDROCARBONS
Reaction of Dimethylaminobenzaldehyde in Sulfuric Acid with Liquid Olefins,
PB-215 224 7C

AMINES
Spot Test Detection and Colorimetric Determinative of Aniline, Naphthylamine and Anthramine Derivatives with 4-Azobenzenediazonium Fluoborate,
PB-215 230 7C

Spectrophotometric Determination of 4-Aminoazobenzenes, 4-Aminostilbenes, Schiff Bases, and Analogous Compounds with 3-Methyl-2-Benzothiazolone Hydrazone,

PB-215 364 7C

AZULENES
Spectrophotometric Determination of Azulene with Electrophilic Reagents,
PB-215 370 7C

CARBAZOLES
Spot Test Detection and Spectrophotometric Characterization and Determination of Carbazoles with 3-Methyl-2-Benzothiazolone Hydrazone, p-Nitrosophenol, and Fluorometric Methods. Application to Air Pollution,
PB-217 661 7C

CHLORINE ORGANIC COMPOUNDS
Identification of Polychlorinated Biphenyls in the Presence of Ddt-Type Compounds.
PB-213 900/0 7C

CROTONALDEHYDE
Spectrophotometric Determination of Crotonaldehyde.
PB-215 300 7C

NITRITES
Electronic Absorption Spectra of Inorganic and Organic Compounds of Nitrogen. II. Butyl and Amyl Nitrites,
PB-216 452 7C

NITROGEN DIOXIDE
Electronic Absorption Spectra of Inorganic and Organic Compounds of Nitrogen: I. Nitrogen Dioxide-Dinitrogen Tetroxide in Solution,
PB-216 680 7B

PHENSOLS
Sensitizing the 4-Aminoantipyrine Reaction with Phenolic Materials for Use in Water and Waste Analysis,
PB-216 759 7C

SEWAGE
Characterization and Separation of Secondary Effluent Components by Molecular Weight.
PB-206 193 13B

SPEED INDICATORS
AIR POLLUTION
Portable Laser Velocimeter for Stack Velocity Measurements.
PB-213 263/7 14B

SPENT LIQUORS (PULPING)
INDUSTRIAL WASTE TREATMENT
Pollution Abatement by Fiber Modification.
PB-206 219 7A

Aerated Lagoon Treatment of Sulfite Pulping Effluents.
PB-208 212 13B

Multi-System Biological Treatment of Bleached Kraft Effluents.
PB-208 213 13B
